

Empowering Educators to Teach Cyber

The goal of CYBER.ORG is to empower educators as they prepare the next generation to succeed in the cyber workforce of tomorrow.

CYBER.ORG provides educators and caregivers with the curricula and resources needed to deliver industry-leading cybersecurity content to K-12 students. Educators can access in-person, virtual, or self-paced professional development (PD) to facilitate the integration of cybersecurity education into their classrooms. Using the secure, virtual environments of the CYBER.ORG Range, students can practice real-world cybersecurity skills and experience simulated cyber attacks.

Supported by a grant through the Cybersecurity Infrastructure and Security Agency (CISA), CYBER.ORG is able to offer these resources at no-cost across the U.S.

Taking a closer look at CYBER.ORG activity in

Delaware

“CYBER.ORG resources have been invaluable in my classroom, providing engaging, real-world cybersecurity content that sparks curiosity and builds essential skills in my students. The hands-on activities and relevant scenarios help demystify complex topics, allowing students from diverse backgrounds to see themselves in cybersecurity careers. I’m most proud of the moments when students who never considered computer science realize their potential. Watching them excel—whether it’s leading Drone teams, earning top placements in TSA competitions, or stepping into leadership roles—reminds me why I teach.
